

SKILLVERSE – GEN AI & LLM APPLICATION

Activity Report: Exploring Generative AI Image Tools

Name: Asiya Maryam

Register No.: E24AI004

Date: 25 August 2026

Topic: Generative AI – Image Generation and Creative AI Tools

1. Introduction

As part of the **Skillverse – Gen AI and LLM Application** activity, I explored various Generative AI tools that can be used to create images and other forms of creative digital content using artificial intelligence.

The activity focused on understanding how **Generative AI** can transform simple text prompts or ideas into visual content. I experimented with different AI platforms and observed how they interpret prompts, generate images, and provide different creative results.

The tools explored during this activity included **Craiyon AI** and **Rosebudd AI**, along with other Generative AI image-generation tools.

2. Objective

The main objectives of this activity were:

- To understand the basic concept of **Generative AI**.
- To explore AI-based image generation.
- To understand how **text prompts** can be used to create images.
- To experiment with different prompt styles and descriptions.

- To observe how different AI tools produce different visual outputs from similar ideas.
- To understand the practical applications of Generative AI in creative fields.

3. Tools Explored

Craiyon AI

Craiyon AI is a Generative AI tool that creates images based on text prompts. I experimented with different descriptions and observed how the AI converted the given text into visual outputs.

The tool helped me understand the relationship between the **prompt provided and the generated image**. Changing the description or adding more details could result in different visual interpretations.

Rosebudd AI

Rosebudd AI was also explored as part of the activity. It provides AI-powered creative features that can be used for generating and developing visual content.

By experimenting with the tool, I gained a better understanding of how AI can assist in the creative process and help users turn ideas into digital content.

4. Prompt Experimentation

One of the important parts of the activity was experimenting with different prompts.

A simple prompt can produce a general image, while a more descriptive prompt can provide the AI with additional information about the subject, environment, style, lighting, and overall appearance.

For example, instead of providing a basic prompt such as:

"A futuristic city"

a more detailed prompt can describe the environment, atmosphere, architecture, lighting, and artistic style.

This experimentation helped me understand the importance of **prompt engineering** when working with Generative AI systems.

5. Observations

During the exploration, I observed that:

- AI can generate images from simple natural-language descriptions.
- The quality and relevance of the output depend significantly on the prompt.
- Adding specific details can make the generated result closer to the intended idea.
- Different AI tools interpret the same prompt differently.
- Generative AI can be useful for brainstorming and visualizing ideas quickly.
- AI-generated content can be used in areas such as design, education, entertainment, marketing, gaming, and content creation.

6. Learning Outcomes

Through this activity, I gained practical exposure to **Generative AI-based image creation**.

I learned:

- What AI image generation means in practice.
- How text-to-image generation works from a user perspective.
- The importance of writing effective prompts.
- How different Generative AI platforms produce different results.
- How AI can support creativity rather than only traditional programming tasks.
- The potential applications and limitations of Generative AI in real-world scenarios.

This activity also gave me a better understanding of how Generative AI is becoming an important part of modern **AI and LLM applications**.

7. Conclusion

The exploration of Generative AI image-generation tools was a useful practical activity under the **Skillverse – Gen AI and LLM Application** program.

Experimenting with tools such as **Craiyon AI** and **Rosebud AI** helped me understand how natural-language prompts can be transformed into creative visual outputs. It also demonstrated the importance of prompt engineering and experimentation when working with Generative AI.

Overall, the activity provided hands-on experience with modern AI tools and helped me understand their potential for creative and practical applications.
